DETAILED ACTION

Claims 1-15 are pending and examined.

Claim Objections

Claims 4-13 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim cannot depend from any other multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims have not been further treated on the merits.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 14 and 15 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claims 14 and 15 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite in that it fails to point out what is included or excluded by the claim language. These claims are an omnibus type claim.

Claim Rejections - 35 USC § 101

35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claim 14 is rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. Claim 14 recites a method (process) without reciting any process steps that results in an improper definition of a process.

Conclusion

Osborne et al (Biotech. 13:1474-1478, 1995) is the closest prior art to claims 1-3 because it serves the same general purpose as the method of claim 1 and shares most of the features therewith. Osborne et al discloses a screening method for regulatory enzymes comprising the construction of a trihybrid (tribrid) cell comprising genes encoding an expression library of putative enzymes, a bait protein or polypeptide fused to a DNA binding domain, and a prey protein attached to an active domain recognizing a post-translationally modified protein, being able to detect post-translationally modified bait proteins by induction of expression of a reporter gene (see p. 1475, col. 1, 2nd para.; p. 1478, col. 1, last para.; Fig. 1). The difference between claim 1 and Osborne et al is that the method of claim 1 employs a fusion protein between an antibody that recognizes a post-translationally modified protein, and a protein activation domain, as the 'prey'. There is no hint in prior art documents to employ a fusion between an antibody specific for a post-translationally modified protein fused to a protein activation domain as a 'prey' in a tribrid cell system.

Allowable Subject Matter

Claims 1-3 are allowed.
